

Code Files Description

- `tvar_main.m` — Main estimation file for the threshold VAR model. It loads the data, sets the model specification and priors, runs the Bayesian estimation, and saves the posterior draws.
- `TVAR_phi.m` — Draws the TVAR coefficient matrix from its conditional posterior distribution.
- `TVAR_Sigma.m` — Draws the reduced-form covariance matrix from its conditional posterior distribution.
- `TVAR_evolirf.m` — Computes evolving impulse response functions, where the response path is allowed to move across regimes over the forecast horizon.
- `TVAR_fixedirf.m` — Computes fixed-regime impulse response functions, where the economy is held in a given regime while the shock response is traced out.
- `tvar_plotirf.m` — Generates plots of the impulse responses and reports posterior summaries such as median responses and credible intervals.
